Application Management API

Learn how to use the Application Management API.

You use the Application Management API to rotate the client secret on registered applications.

Current version	Legacy versions	Availability	Sandbox
v2023-11-30 (Reference Model)	None	Sellers and Vendors	Static

► [Release notes](#)

To learn more about the terms that are used in this guide, refer to [Terminology](#).

Use cases

The following use case examples are available for the Application Management API v2023-11-30:

- [Set up credential rotation notifications](#): Set up a credential rotation notification in Amazon Simple Queue Service (Amazon SQS) queue that alerts you when your credentials need to be rotated.
- [Rotate your application's client secret](#): Call the `rotateApplicationClientSecret` operation to rotate your client secrets.

Roles for the Application Management API v2023-11-30

► [rotateApplicationClientSecret](#)

You must register an Amazon Simple Queue Service (Amazon SQS) queue for receiving credentials before you call the `rotateApplicationClientSecret` API

operation. When you make the API call, a new client secret is created for the application that you're calling. The new credential is sent to your preregistered SQS queue along with the expiry time for the old credentials. You must update your application to use the new credential before the old credential expires.

Best practices

- **Use the expiration notification:** We recommended using the expiration notification to invoke a rotation. The expiry time that is in the expiry notification serves as an indicator of when you need to rotate credentials.
- **Enable server-side encryption for SQS:** For security, enable SQS server-side encryption and grant Amazon access to write to your SQS queue. For more information, refer to [Set up notifications using the Amazon Simple Queue Service workflow](#).
- **Store your credentials in your application's credential vault:** For security, make sure you don't pass the secret in an unencrypted format. We recommended storing credentials in a credential vault, such as [KMS custom keys store](#).
- **Test your integration:** Use the Application Management API on a draft application before using it on a production application. You can then test your infrastructure for loading the secret from your SQS queue to your application secret vault independently of your production application. After you receive the new secret for the draft application, use it to make sure it works.
