What is the Selling Partner API?

Selling Partner API Onboarding Overview >

Cancel and change orders

Learn how to return order changes and cancellations.

You can return order changes and cancellations using the `getPurchaseOrders` operation.

Prerequisites

To complete this tutorial, you need:

- Authorization from the selling partner for whom you are making calls. For more information, refer to [Authorizing Selling Partner API Applications](#).
- The [Vendor Retail Procurement Orders role](#) assigned to your developer profile.

Order changes

Terminology

CHANGELOG[SP-API Release Notes](#)[SP-API Deprecation Schedule](#)[SP-API Product Metadata Updates](#)**DIRECTORIES**[SP-API Models](#)[SP-API Seller Use Cases](#)[SP-API Vendor Use Cases](#)[Seller Central URLs](#)[Vendor Central URLs](#)**REGISTRATION**[SP-API Registration Overview](#)[Developer Registration Request Status](#)[Third-Party Provider Registration](#)[Service Provider Registration and Role Approval Process Overview](#)[Website Guidelines for Public Developers and Service Providers](#)[User Permissions for Service Providers](#)[Register your Application](#)[Update your Application Information](#)[Rotate your Application's LWA Credentials](#)[View your Application Information and Credentials](#)[Learn How Sellers Authorize Service Providers](#)[Selling Partner API Roles](#)

Amazon may change purchase orders after creation when requirements change. You can use the

`getPurchaseOrders`

operation to get updated orders. If Amazon changes a purchase order, the order contains a `purchaseOrderChange dDate` field that is the timestamp when Amazon updated the order. If this field does not exist, the order has not changed since creation.

You can use the `changedAfter` and `changedBefore` query parameters to retrieve a list of orders that have changed in a date range. The response returns the orders that Amazon changed within the specified date range, and you must fulfill the updated purchase order. Alternatively, you can filter using `isPOChanged=true` to get all changed purchase orders.

You can make separate API calls with a modified date range to get the changed orders for that day. For example, call the `getPurchaseOrders` operation four times a day to get the orders

changed in the last six hours.

The following is a list of changes that can contribute to order changes. For these changes, you must pull the changed order and ship the correct purchase order:

- Ship or delivery window change
- Purchase order item updates such as quantity change, item cancellation, or item cost change
- New item added to purchase order
- Purchase order canceled/uncanceled
- Purchase order type change
- Purchase order delivery destination (fulfillment center) change
- Purchase order freight information change

Backorders

The backorder policy is determined by your Amazon business representative. Read the value in the `isBackOrderAllowed` field in the `getPurchaseOrders`

API response to determine whether a backorder is allowed. When `true`, the order can be processed as a backorder. When `false`, backorders are not accepted.

You must provide the price data for items on backorder. Amazon can then update the status of the order correctly. If the price is omitted, the acknowledgment is rejected.

Item cancellation

You can use the Vendor Orders API with

`poItemState=Canceled` to find orders with canceled items. This returns all orders that have had one or more items canceled by Amazon after purchase order creation. This helps you get only the orders that have canceled items (ordered quantity is zero) and helps ensure that you don't ship the canceled items.

Note

Item cancellation is an order change. Include canceled items when

you return the list of changed orders.

Purchase order state and vendor code

The purchase order schema includes the current purchase order state and state update time. You can use the filter

`purchaseOrderState` to filter orders based on the current state.

For example, you can get all purchase orders that you have not acknowledged or fulfilled using `purchaseOrderState=New`.

You can also get purchase orders for a specific vendor code by providing one of the authorized vendor codes in filter

`orderingVendorCode`. This filter returns only purchase orders for the vendor code included with the filter.

For all available filters, refer to the [Vendor Orders API Reference](#).
