Create an inbound order for shipment

Learn how to use the AWD API to create an inbound order.

Learn how to create an AWD inbound order for shipment.

Prerequisites

To complete this tutorial, you need:

- Authorization from the selling partner for whom you are making calls. For more information, refer to [Authorizing Selling Partner API Applications](#).
- The [Amazon Warehousing and Distribution role](#) assigned to your developer profile.
- The Amazon Warehousing and Distribution role selected in the app

registration page
for your
application.

Learn How Sellers Authorize Service Providers

Selling Partner API Roles >

Step 1a. (Optional) - Determine if the packages that you specify are eligible for an AWD inbound order

Call the
`checkInboundEligibility` operation.

Step 1. Create an AWD inbound order

Call the
`createInbound`
operation (Amazon
creates a single
shipment per order).

The
`packagesToInbound`
must contain a list of
packages that you want
to inbound.
`ProductQuantity`
must include the MSKU,
quantity, and party that
prepares or labels the
item. The SKU limit for
an inbound order is 150
unique SKUs.

Note

Each item
that you ship
must

SECURITY AND COMPLIANCE

SP-API Security and Compliance Overview

Amazon Selling Partner API Guard Implementation Guide

Create an inbound order for shipment

inbound
orders.

Step 2. Review the inbound order

To review the inbound order details and destination address, call the `getInbound` operation.

Note

The inbound `ShipmentId` generates only upon confirmation of the inbound order.

Step 2b. Update the inbound order

The `updateInbound` operation updates the draft AWD inbound order for the packages that you want to inbound. You can only update AWD inbound orders in `DRAFT` status and that don't have seller confirmation.

Note

When you update an inbound order, the

system re-evaluates the order details. This re-evaluation process might result in the assignment of a different destination address for the inbound shipment.

>

Call the `updateInbound` operation.

Amazon Seller Data Access
Best Practices

>

★ Tip

After you update the inbound order, use the `getInbound` operation to review the inbound order details and confirm the destination address.

Step 3. Confirm the inbound order

With the `confirmInbound` operation, you can confirm an AWD inbound order in

DRAFT status. This confirmation is a requirement for all transportation types and indicates that the order details are ready for further processing. After an order reaches **CONFIRMED** status, it advances in the inbound workflow and the next steps in the inbound shipping process begin.

 Note

Inbound shipments must be confirmed within 90 days after creation. After this period, the inbound order expires.

Step 4.

Generate the box labels

Call the [getInboundShipmentLabels](#) operation to request unique box labels for your inbound shipments. After you make the call, poll the system regularly to check for a **GENERATED** [labelStatus](#). When the box labels are ready, affix each box label with its

corresponding package in the shipment. The labels indicate the package contents and help the AWD distribution center process your shipment quickly and accurately.

**Note**

The labels that you generate are valid for 600 seconds and are in a compressed .zip file format.

**Note**

The `shipmentId` is created after an inbound shipment has been confirmed. You can call the `getInbound` operation and `shipmentId` is included in the response under `destinationDetails`.
Alternatively, you can call the

`listInboundShipments`

operation and filter for the `shipmentId` with the respective `orderId`.

Step 5. Update the tracking information

You must update the tracking information after you send shipments to AWD distribution centers with non-partnered carriers. The

`updateInboundShipmentTransportDetails`

operation requires that you input the `shipmentId` and transportation information.

For small parcel shipments, you can provide only one booking ID. Amazon uses the booking ID to track and manage incoming inventory.

Call the

`updateInboundShipmentTransportDetails`

operation.
