Fulfillment Inbound API

Learn how to use the Fulfillment Inbound API.

You use the [Fulfillment Inbound API](#) to create and update inbound inventory to Amazon's fulfillment network, where Amazon can fulfill your customer's orders. You can also request lists of inbound shipments or inbound shipment items based on criteria you specify. After your inventory has been received in the fulfillment network, Amazon can fulfill your orders regardless of whether you are selling on Amazon's retail website or through other retail channels.

For details about API operations and associated data types and schemas, refer to the [Fulfillment Inbound API reference](#).

Current version	Legacy versions	Availability	Sandbox
v2024-03-20 (Reference Model)	v0	Sellers only	Static

[Release notes](#)

Fulfillment Inbound API

`listPrepDetails` operation. Prep details you add in Seller Central are not returned by `listPrepDetails`.

The Fulfillment Inbound API has the following key features:

- **Create an inbound shipment:** The Fulfillment Inbound API accepts POST operations to create new inbound plans and select shipping modes and transportation options to determine the shipments.
- **Retrieve details about inbound shipments:** The Fulfillment Inbound API accepts GET operations to return detailed information about an existing shipment.
- **Update inbound plans:** The Fulfillment Inbound API accepts POST operations to update one or more individual attributes for an existing inbound plan, such as updating the inbound plan name or tracking ID.
- **Delete inbound plans:** The Fulfillment Inbound API accepts a PUT operation to delete an existing inbound plan.
- **Interoperability:** Plans created with the Fulfillment Inbound API can be accessed and edited on Amazon's UI, [Send to Amazon](#) (STA), once placement and transportation options are confirmed. You can also use the API to access plans that were created in [STA](#) after you confirm placement and transportation options.

★ Tip

Use `generatePlacementOptions` to generate new placement options and `generateTransportationOptions` to generate new transportation options. If you switch from the API to STA before you confirm your options (with `confirmPlacementOption` and `confirmTransportationOptions`), new options are generated in STA and all previous options are discarded.

Use cases

The following use case examples are available for the Fulfillment Inbound API:

- [Create an inbound shipment](#): Create an inbound shipment with or without carton-level

Considerations

The Fulfillment Inbound API supports shipment creation in all marketplaces except Brazil.

The following v0 operations are not deprecated:

- [getLabels](#)
- [getBillOfLading](#)
- [getPrepInstructions](#)
- [getShipments](#)

- [getShipmentItemsByShipmentId](#)
- [getShipmentItems](#)

A+ CONTENT API

A+ Content API

Of these, `getLabels` and `getBillOfLading` are necessary to create shipments because they print box labels, pallet labels, or bills of lading.

A+ Content Examples

AMAZON WAREHOUSING AND DISTRIBUTION API

Amazon Warehousing and Distribution API

Fulfillment Inbound shipping workflow

There are two main processes that a seller can follow to create a shipment:

- Create a shipment when the seller knows the carton-level information up-front.
- Create a shipment when the seller does not know the carton level information up-front. **This is only available for LTL shipments.**

Amazon Warehousing and Distribution API v2024-05-09 Reference

In most cases, we expect that sellers would know the carton-level information, but there are situations where this information isn't readily available.

Ship inventory in the India marketplace

For details on how to ship inventory in the India marketplace, refer to [Ship Inventory to Amazon Fulfillment Centers in India](#).

More specific ways to create shipments

- 1. Small Parcel Delivery (SPD) with an Amazon-partnered carrier (PCP):** Sellers can create inbound shipments using Amazon's partnered carriers for small parcel deliveries, that is, individual boxes.
- 2. Small Parcel Delivery (SPD) with a non-partnered carrier (nPCP):** Sellers can use non-partnered carriers, that is, their own transportation carriers for small parcel deliveries. Sellers can choose their preferred shipping carriers and still have access to the benefits of FBA.
- 3. Pallets (LTL/FTL) with an Amazon-partnered carrier (PCP):** For larger shipments, sellers can create pallet deliveries using Amazon's partnered carriers. This method is ideal for bulk shipments that require less-than-truckload (LTL) or full-truckload (FTL) services.

4. Pallets (LTL/FTL) with non-partnered carriers (nPCP): Sellers have greater control over the

logistics of larger shipments by using their own non-partnered carriers.

5. Pallet deliveries with the Pack Later option:

Sellers can create pallet deliveries even when carton or box packing information isn't provided upfront. This "Pack Later" flexibility enables sellers to finalize packing details later.

6. Retrieve inbound plan details: Sellers can retrieve detailed information about their inbound plans through GET operations, which allows them to track and manage their shipments.**Additional functionality**

The Fulfillment Inbound API v2024-03-20 also includes several operations that are not mandatory for every shipment creation. For more details on these operations, refer to [Additional Functionality](#).

The Amazon-Recommended Packing Option

Pack groups are groups of SKUs that can be packed together. SKUs that cannot be packed together are separated into different pack groups. Each pack group should be packed and labeled separately. When you create a new inbound shipment, there are multiple pack groups to choose from in the [listPackingOptions](#) response. Sellers can get customized pack groups tailored to their specific inbound shipment and receive a fulfillment discount by following Amazon's packing recommendations. The recommended packing is only available when you pack in small parcel deliveries with each parcel weighing less than 15 kg (LTL/FTL not supported).

If you select Amazon's recommended packing method, you do not need to split the shipment more than usual. You can ship your inventory in as many small parcels as needed, as long as the parcels contain the correct SKUs and the Amazon-recommended quantities for each pack group. If the seller selects a partnered carrier, meaning that `destinationType` is `AMAZON_OPTIMIZED`, then the destination fulfillment center address may differ from the actual address, or this field may be empty. Refer to the carton label for the correct address.

Amazon-recommended packing options are available in the following marketplaces:

- Spain
- UK

- France
- Germany
- Italy

For more information about the Amazon Recommended Packing options, refer to [Help for Amazon Sellers](#). To learn about how to access these options via API, refer to [Determine which SKUs can be packed together](#).

Sample code application

The [Fulfillment Inbound Sample Solution Code App](#) includes detailed code samples and all the necessary resources to deploy a fully functional SP-API application that uses the Fulfillment Inbound API v2024-03-20. You can adjust the code to fit your specific requirements.
