Selling Partner API Onboarding Overview >

Listings APIs FAQ

Frequently asked questions about Listings APIs.

▼ Why are items showing as restricted or cannot be added?

Items show as restricted if you don't have access to the product type. If you have access issues, reach out to your vendor manager or [Contact Us](#), making sure to specify that your issue is an API inquiry.

▼ Can I edit my cost price via API?

You cannot use the API to increase prices for existing items. Significant price decreases also need to be verified. In this case, contact your vendor manager or

open a [Contact Us](#) case. Then, upload your cost changes through **Items > Edit Item Costs**.

▼ The original values submitted by the vendor are no longer accepted. How can we successfully submit?

In some edge cases the schema might have changed and the original values that a vendor submitted are no longer valid. If this is the case, ask the vendor to open a case with the [Amazon Support team](#).

▼ How do I update A+ premium content?

A+ premium content is not supported.

▼ Why are my edits not making it to the detail page even though they appear as successful?

The APIs provide an alternative method for

[Policies and Agreements](#)[About Facial Data](#)

AUTHORIZATION

[Authorize Applications](#) >[Renew Authorizations](#)[Revoke Authorizations](#)[Authorization Limits](#)[Special Authorization Types](#) >

sending catalog data to Amazon. Downstream process and rules governing catalog data are the same regardless of submission method. In some cases, especially where we already have a listing for a product, the information submitted by a vendor might not have priority.

INTEGRATION

[Building Robust Amazon SP-API Applications](#)[SP-API SDKs](#) >

▼ [Why is there no summary information in my Listings Item Get API response?](#)

The summary view displays information about the ASIN you are creating a listing against. If the summary view is not populated it is because the submission failed and did not match an ASIN. Make sure to check the schema and format for your product type and try again. If the issue persists, open a [Developer Support case](#).

▼ I submitted my listing without issues, but I cannot find it listed.

Where is it?

Your listing might have experienced an issue after submission (an asynchronous issue). To view such issues, use the `getListingsItem` operation.

▼ What does the Does not match your product categories issue message mean?

If you receive a `Does not match your product categories` message, the ASIN is set up in a product category the vendor does not have access to. Submit a [Contact Us](#) case via Vendor Central noting the message, ASIN(s), and correct product type. Open a case with [Developer Support](#) if you require technical support or where indicated in the troubleshooting guide.

▼ What do you mean by Not Supported – the following products cannot be added issue message?

If you receive a “Not Supported – the following products cannot be added” message, submit a [Contact Us](#) case via Vendor Central noting the issue message and impacted ASINs / external ID(s). Open a case with [Developer Support](#) if you require technical support or where indicated in the troubleshooting guide.

Product schemas

▼ How do I determine the listing requirements to list a new product on Amazon?

To identify the appropriate listing requirements, you must first select the correct product type. This allows Amazon to provide all necessary listing

requirements upfront. The following steps outline the process:

1. Use the `searchDefinitionsProductTypes` operation to get a list of applicable product types for your selling partners. If you have a product title, you can get a high-confidence recommendation for the product type by passing the `itemName` parameter. With the `itemName` parameter, you can combine the product title and description to get more granular product type suggestions. You can also use `keywords` to search through product types or pass an empty

parameter to return the entire list of available product types. For additional information, refer to the [Product Type Definitions API Use Case Guide](#).

2. After you know the product type, call the [getDefinitionsProductType](#) operation with the `requirements` parameter to retrieve the requirements to create a new listing.

▼ [Does the schema version update when the product type JSON schema changes?](#)

Yes. The schema version always updates to the latest version of the Amazon product type definition.

There are multiple ways to identify changes between two schema versions:

▼ [How frequently do Amazon catalog requirements change?](#)

Based on customer search and buying signals, Amazon reviews product attributes regularly and plans necessary updates for the last week of every month.

Sometimes, Amazon makes some updates before the planned release to address customer feedback and resolve any defects or gaps.

Most of the changes are minor and don't affect customer behavior. Before you update any attribute for your listing submission, use the [Product Type Definitions API](#) to get the latest JSON schema.

▼ How do I use the `$lifecycle` attribute in the Product type definition metadata in the workflow?

Use the `$lifecycle` attribute to find details about deprecated content and actions to take. Deprecated content is content that is still technically valid but is removed in the future. For example, the `enumDeprecated` element of the `$lifecycle` attribute lists deprecated enumeration values that you should work to replace with the latest values.

Listings submissions

▼ What are the different ways to programmatically list items on Amazon?

You can list items on Amazon in the following ways:

the operation completes, the feed processing report includes validation feedback from the [Listings Items API v2021-08-01](#).

For more information, refer to the [Building Listings Management Workflows Guide](#).

▼ [What's the difference between the Catalog Items API v2022-04-01 and the Listings Items API v2021-08-01?](#)

The [Catalog Items API v2022-04-01](#) provides information at the ASIN level, which is reconciled from various listings against that item. The [Listings Items API v2021-08-01](#) provides information about the specific listing submitted by a selling partner.

▼ [Can the data that the Catalog Items API v2022-](#)

Orders API

04-01 returns

differ by
marketplace?

Yes. The [Catalog Items API v2022-04-01](#) returns data associated with an ASIN. An ASIN represents the same physical item in every marketplace, with few exceptions. However, the data for each ASIN differs by marketplace because countries have different data requirements specific to that marketplace.

PRODUCT FEES API

Product Fees API

Additionally, because most attributes are localized text, the text can differ depending on the marketplace or locale, even when the text describes the same product.

Use the `marketplaceIds` filter in the [Product Type Definitions API v2020-09-01](#) operations to get the marketplace-specific requirements to create or update products.

▼ Is it possible to create a product on Amazon without an ASIN or product identifier (UPC, GTIN, or EAN) with the Listings Items API v2021-08-01?

Yes. If you don't have a product identifier, you can create a product with a GTIN exemption. For exemption, you must submit a manual exemption request through your Seller Central account. For more information, refer to [Seller Central](#). After you have received an approval, you can create a listings submission through the [Listings Items API v2021-08-01](#). You must provide the brand name approved for the GTIN exemption and set the `supplier_declared_has_product_identifier_exemption` attribute to `true`.

Supply Sources API >

EED , does the JSON feed update overwrite the patch call?

No. Amazon uses submission timestamps to ensure that updates happen in the correct order.

When you upload a JSON LISTINGS FEED with inventory updates, Amazon records the feed submission time as the timestamp for all updates within the feed. If you then initiate an inventory update through the

patchListingsItem operation, the system assigns the request submission time as the timestamp for that inventory update. In this scenario, if the

patchListingsItem operation gets processed first, then it overrides the data provided in the JSON LISTINGS FEED .

No. The

[JSON LISTINGS FEED](#) and [Listings Items API v2021-08-01](#) supports a single marketplace per feed.

▼ [Who has the highest precedence to override the product details page information on Amazon?](#)

Brand owners have the highest precedence to update data on the product details page on Amazon. If Amazon uses its own data on the product details page, brand owners can override it via a ticket to Seller Central support.

▼ [How can I convert a Fulfilled by Merchant \(FBM\) listing to Fulfilled by Amazon \(FBA\)?](#)

If you have an existing listing with FBM fulfillment, you can convert it to FBA with the Listings Items API or the Feeds API. For more information, refer

VENDOR DIRECT FULFILLMENT ORDERS API

Vendor Direct Fulfillment Orders API >

to [Convert FBM to FBA guide](#).

VENDOR DIRECT FULFILLMENT SHIPPING API

Vendor Direct Fulfillment Shipping API >

▼ [How can I validate my listings data before making a production call?](#)
Before you submit a listing, verify that the attributes of the listing adhere to the JSON schema for the product type. For information about JSON schema validation utilities, refer to [Amazon Product Type Definitions Meta-Schema \(v1\)](#).

VENDOR DIRECT FULFILLMENT PAYMENTS API

VENDOR RETAIL PROCUREMENT TRANSACTION STATUS API

Vendor Retail Procurement Transaction Status API >

▼ When do I find out if there are issues with my listings?

Amazon performs multiple validations on listing submissions made by selling partners. Some of these validations are returned synchronously in response to the submissions. If you upload the listings data with the [Listings Items API v2021-08-01](#) and the submission status is

ACCEPTED , then the submission passed the synchronous validations. Amazon sends the submission downstream to create or update the SKU. There are a number of downstream processes that are then performed to create or update an item in the Amazon catalog. Any of these downstream processes can generate issues

which are returned asynchronously. For example, if a listing submission contains data which conflicts with another item in the Amazon catalog. To create or update items successfully in the Amazon catalog, you must handle reported issues synchronously and asynchronously. For more information about listing issues, refer to [Handling listings item issues](#) and [Listings Items API Issues Troubleshooting](#).

▼ [How can I confirm the creation of my product in the Amazon catalog?](#)
Amazon sends a [LISTINGS_ITEM_STATUS_CHANGE](#) notification when the status of a listing item changes. A notification gets published when the buyability changes for a listing item, or upon the creation or deletion of a listing item. To

receive a notification when a listing gets created, subscribe to the

[LISTINGS_ITEM_STATUS_CHANGE](#)

notification. The `ListingsItemStatus` attribute returned in the payload contains the current status associated with the affected listings item. If there is no value, the status state is not applicable to the listings item. For example, if

`DISCOVERABLE` is not present, Amazon retail cannot search for the listings item.

▼ [Why is there a noticeable delay between when changes to a listing item are reflected in the `getListingItem` operation results versus when the \[LISTINGS_ITEM_ISSUES_CHANGE\]\(#\) and \[LISTINGS_ITEM_STATUS_CHANGE\]\(#\) notifications are received in the SQS queue?](#)

There can be a delay because the

Amazon backend updates every 15 minutes. As a result, every update might be delayed by 0-15 minutes depending on when the update occurred in that window. For example, a 15-20 minute delay for the

[LISTINGS_ITEM_ISSUES_CHANGE](#) and [LISTINGS_ITEM_STATUS_CHANGE](#)

notifications is normal. Our data sources can be up to 15 minutes behind because the data sources rely on many upstream processes to send updates for notifications.

In contrast, the [getListingItem](#) operation directly queries the current state, which is why the results are available faster (within 1-5 minutes). To minimize throttling errors, you must use push notifications to receive real-time updates for status changes and issues with listings.

▼ Why do I receive an error for missing attributes after submitting a product, when those attributes are not part of the Product Type JSON schema?

Throughout the process phase of a listing submission, Amazon evaluates the listing. If the listing deviates from the selected product type, the listing's product type switches to a recommended product type. This results in attributes from the new product type to show up as missing. We convey information about a changed product type through a warning on the listing.

You can use the [searchDefinitionsProductTypes](#) operation to retrieve a list of all the applicable product types. To retrieve a high-confidence recommendation for the correct product type with this operation, use

the `itemName` parameter.

▼ What to do if I reach the rate limit with the `JSON LISTINGS FEED` ?

With the `JSON LISTINGS FEED` , you can send up to 25,000 SKUs in a single request and submit five requests every five minutes. To prevent throttling issues, instead of sending small feeds, send one large feed. Uploading multiple small feeds every few seconds is inefficient and can result in a backlog. This can block other feeds from processing and force you to cancel some of the previously submitted feeds. Instead of sending the same data, only send updated information to reduce the number of calls. For information about how to optimize your feed submissions, refer

to [Feeds API Best Practices](#).

▼ [Did my image update apply globally?](#)

The image attributes provided by the [Listings Items API v2021-08-01](#) operations map images to ASINs at a global level where the ASIN exists, even if you specify the `marketplace_id` selector. This behavior is consistent with other experiences, such as **Add a Product** within Seller Central.

▼ [How can I verify the validity of an Amazon ASIN before listing an offer?](#)

Before creating an offer for an ASIN, use the [Catalog Items API](#) to verify if the ASIN exists in Amazon's catalog for the specified marketplace. If an exact match is found and a valid ASIN is returned, use the [Listings Restrictions API](#) to check if you are

eligible to list that ASIN. Complete both steps before creating an offer-only listing. After verifying the ASIN and checking for restrictions, create the offer-only listing. For more information, refer to [List an offer for an item that already exists in the Amazon catalog](#).

▼ Can

searchCatalogItems
return
multiple ASINs
when you search
by an identifier
such as an EAN,
UPC, or ISBN?

The catalog systems make no guarantees about a 1:1 mapping between external product identifiers (for example, EAN, UPC, ISBN) and ASINs. An ASIN can have multiple external product identifiers, and an external product identifier can map to multiple ASINs. If an external product identifier maps to multiple ASINs, you can use the [Catalog Items](#)

[API](#) to inspect the attributes and identify the correct ASIN.
