Manage Listings Issues

Learn how to identify, retrieve, and troubleshoot Listings issues.

The Listings Items API provides programmatic access to selling partner listings on Amazon. You can create, edit, delete, and retrieve details about Amazon listings (SKUs) for a selling partner. This includes product facts (such as item titles) and sales terms (such as price and inventory). When working with the Listings Items API, you may encounter issues during listing creation, updates, or validation. This guide shows you how to identify, retrieve, and resolve these issues.

What are Listings Issues?

Within the listing experience, you can access issues during different parts of the process. When you submit data with the Listings Items API, Amazon performs validations that return responses synchronously or asynchronously.

Synchronous validation provides immediate feedback that prevents acceptance and further processing of the submission. If the submission passes the initial synchronous validations, the submission is accepted and is sent downstream to create or update the SKU. However, **Accepted** does not mean the process is complete. Multiple downstream processes create the item in the Amazon catalog, and any of these processes can generate issues that return asynchronously. During this processing, Amazon validates the submitted data against existing content and returns listings issues asynchronously.

It is crucial to effectively manage both synchronous and asynchronous issues to ensure smooth listing operations.

Issue types

There are two types of issues:

- **Synchronous issues:** Occur when the server rejects the initial submission and you can see the errors immediately. These cover input data validations, such as missing required attributes and invalid attributes.
- **Asynchronous issues:** Occur after a request passes initial validation but fail during downstream processing. These issues return as detailed messages with resolution guidance.

Access Listings issues

Listings issues are accessed through the following mechanisms:

- **Direct API responses:** Retrieve issues directly in the API responses for synchronous Listings Items API submissions that prevented acceptance.

Special Authorization Types >

- **Direct API requests:** Use the `getListingsItem` (single SKU) or `searchListingsItems` (multiple SKUs) operations with the `includedData=issues` parameter to retrieve issue details about a single or multiple listings.
- **JSON_LISTINGS_FEED processing reports:** Access feed processing reports for the `JSON_LISTINGS_FEED` submissions through the Feeds API, which include both synchronous and asynchronous issues.
- **Notifications:** Subscribe to asynchronous `LISTINGS_ITEM_ISSUES_CHANGE` notifications to receive near real-time updates when the listings item issues change after making the submission.

Best practices to prevent Listings issues

The following sections help you understand how to prevent and handle listing errors effectively.

Pre-validate your Listings payload using the Product Type Definitions API

Listings data submitted to the Listings Items API must conform to the JSON Schema format provided by the [Selling Partner API for Product Type Definitions](#). Use the Product Type Definitions API to retrieve the latest JSON schema for a product type. Validate your payload against the [meta-schema](#) before submission. Verify required and conditionally required attributes, as dynamic conditions may change requirements based on other attribute values. Review the `allOf` property in the product type JSON schema to identify conditional requirements.

For more guidance, refer to the following resources:

- [JSON schema support](#) documentation.
- [JSON schema](#) tools for rendering user interfaces and validating listings data.
- Tutorial [videos](#) on using [Product Type Definitions API](#) to create and validate product JSON schemas.
- [Selling Partner Listings sample application](#) on GitHub demonstrates an end-to-end listings experience for managing common listings use cases. It features a dynamic UI implementation based on the product type JSON schema and provides a mini Seller Central experience where you can add, delete, update, and test your listings. Refer to the [video tutorial](#) to set up and install the application.

Preview listing errors using Validation Preview mode feature

! Important

This mode has lower rate limits and is intended for testing a small number of listings. It is not designed for production workflows.

The `VALIDATION_PREVIEW` feature in the Listings Items API provides a test environment to identify asynchronous errors that could prevent a listing from being created or updated, without persisting the data in production.

When you use the Validation Preview mode of the Listings Items API, the error codes in the `issues` array of the response are updated. The validation logic remains functionally equivalent, but error codes change to reflect our enhanced validation system.

Action required

INTEGRATION

Building Robust Amazon SP-API Applications
SP-API SDKs

- **Review your error handling logic:** If your application parses or matches specific error codes from Validation Preview responses, update your code to handle both current and new error codes.
- **Update error code mappings:** Use the reference table below to map current error codes to their new equivalents in your application.
- **Test with Validation Preview:** We recommend testing your integration with the Validation Preview mode of the Listings Items API to observe the new error codes and ensure your application handles them correctly.
- **Monitor your integration:** Monitor your Validation Preview requests to identify any unexpected behavior.

The following table shows the mapping between current error codes and new error codes:

Current error code	New error code	Validation rule
90000640	90242	Less than value rule violated
90000642	90195	Max precision rule violated
8333	90244	Invalid enumerated attribute value
90000691	90004207	Diff less than or equal to attribute rule violated
100334	5886	Generic ASIN merchant not authorized
90004114	90114	Min value rule violated
90004118	90194	Pattern rule violated
90001217	90004200	Missing fabric type material percentage
90004401	99022	Attribute field min occurs rule violated
90000644	90232	Max scale rule violated
90004117	99016	Max occurs rule violated
90000595	90230	Same value rule violated
90003944	99022	Attribute field min occurs with precondition rule violated
90004145	90225	Max length rule violated
90001132	90196	No URLs rule violated
90003951	90248	Attribute field max occurs zero with precondition rule violated
90004115	90197	Max value rule violated
90003859	90004201	Invalid fabric type structure
90000596	90193	Less than attribute rule violated
90004144	90226	Min length rule violated
90000643	99028	Min scale rule violated
90004385	100398	SKU violated with mix intent
90006958	100339	Illegal markup

Appstore Ratings and Reviews

Current error code	New error code	Validation rule
90001214	90004199	Invalid fabric type material order
5461	5995	Merchant not authorized to update
90001212	90003907	Fabric type total sum violation
90000639	90221	Greater than value rule violated
90004147	100095	Invalid value detected
90003945	90004205	Invalid enumerated attribute value with precondition
100333	5887	Generic ASIN merchant authorization blocked
90004119	90188	Invalid UCCID ISBN checksum
100364	100336	Min measurement value violation
90001214	90147	Less than or equal to attribute rule violated

The following is an example of current Validation Preview response:

JSON
<pre>{ "issues": [{ "code": "90004145", "message": "The value provided for 'item_name' exceeds the maximum length of 200 characters.", "severity": "ERROR", "attributeName": "item_name" }] }</pre>

The following is an example of Validation Preview response change:

JSON
<pre>{ "issues": [{ "code": "90225", "message": "The value provided for 'item_name' exceeds the maximum length of 200 characters.", "severity": "ERROR", "attributeName": "item_name" }] }</pre>

Considerations

- **Validation Preview mode only:** These changes affect only the Validation Preview mode (`mode=VALIDATION_PREVIEW`) of the Listings Items API. Standard submission modes are not impacted.

- **Validation logic unchanged:** The underlying validation rules remain the same; only the error codes are changing.
- **Message text may vary:** While error codes are changing, the error messages may also be refined for clarity.
- **Backward compatibility:** We support both current and new error codes to ensure smooth operation.
- **No action required for most integrations:** If your application does not parse or match specific error codes, no changes are needed.

Pricing validation issues

Validation Preview mode surfaces pricing validation issues in addition to catalog and attribute validation. It also detects these pricing issues before submission, so you can fix them proactively.

When you submit a price change using `mode=VALIDATION_PREVIEW`, the response `issues` array includes pricing-related issues with the `INVALID_PRICE` category.

The following table lists the pricing issues returned in Validation Preview mode. Issue `100708` is new to Validation Preview. Issues `19038`, `19037`, and `18701` are also returned in the asynchronous Listings API workflow, and are now surfaced in Validation Preview mode.

Code	Severity	Category	Description	New
100708	WARNING	INVALID_PRICE	Not eligible to be the Featured Offer due to uncompetitive price. Set your price at or below the Competitive External Price to become eligible for the Featured Offer.	Yes
19038	ERROR	INVALID_PRICE	Your selling price is higher than your maximum price setting. Review and adjust either your selling price or maximum price.	No
19037	ERROR	INVALID_PRICE	Your selling price is lower than your minimum price setting. Review and adjust either your selling price or minimum price.	No
18701	ERROR	INVALID_PRICE	The selling price was identified as a potential high pricing error. Please review, and confirm or update your price.	No

! Important

- `WARNING` severity issues (such as `100708`) do not prevent the listing update. The update is accepted, but the offer may not be eligible for the Featured Offer.
- `ERROR` severity issues prevent the listing update. Fix the price and resubmit.
- Issue `18701` occurs when one price type on the offer has a pricing error, and flags other price types on the same offer.

The following is an example of a Validation Preview request with a price change:

```
PATCH https://sellingpartnerapi-na.amazon.com/listings/2021-08-01/items/AXXXXXXXXXXX/MY-SKU-123?marketplaceIds=ATVPDKIKX0DER&issueLocale=en_US&mode=VALIDATION_PREVIEW
```

```
JSON
{
  "productType": "PRODUCT",
  "patches": [
    {
      "op": "replace",
      "path": "/attributes/purchasable_offer",
      "value": [
        {
          "marketplace_id": "ATVPDKIKX0DER",
          "currency": "USD",
          "our_price": [
            {
              "schedule": [
                {
                  "value_with_tax": 90.00
                }
              ]
            }
          ]
        }
      ]
    }
  ]
}
```

The following is an example of a Validation Preview response with a pricing issue:

```
JSON
{
  "sku": "MY-SKU-123",
  "status": "VALID",
  "submissionId": "b2a45cb931234faea118fa24001f8a6f",
  "issues": [
    {
      "code": "100708",
      "message": "Not eligible to be the Featured Offer due to uncompetitive price. You can set your price at or below the Competitive External Price to become eligible to be the Featured Offer",
      "severity": "WARNING",
      "attributeNames": [
        "our_price"
      ],
      "categories": [
        "INVALID_ATTRIBUTE",
        "INVALID_PRICE"
      ]
    }
  ]
}
```

Manage Listings Issues

A status of **VALID** with **WARNING** -level pricing issues means the listing update is accepted, but the offer may not be eligible for the Featured Offer. A status of **INVALID** with **ERROR** -level pricing issues means the listing update is rejected.

> Refer to the following tutorials for more information on previewing errors for a listing before submission:

- [Preview errors before creating or fully updating a listing](#)
- [Preview errors before partially updating a listing](#)

Configure event-driven error handling

> Subscribe to the [LISTINGS_ITEM_ISSUES_CHANGE](#) notifications to receive near real-time updates when issues on your Selling Partners' listings are created, fixed, or updated.

Each notification payload includes key listing identifiers such as SKU, along with related issue [Severities](#), and [EnforcementActions](#) caused by issues. Implement event handlers to consume these notifications and call appropriate API operations (for example, [getListingsItem](#) or [searchListingsItems](#)) to retrieve detailed listings issues data based on the reported severities and actions.

This event-driven architecture eliminates the need for continuous polling, reduces direct API call volume, and enables faster detection of listing issues.

The following is an example of notification payload:

JSON

```
{
  "NotificationVersion": "1.0",
  "NotificationType": "LISTINGS_ITEM_ISSUES_CHANGE",
  "PayloadVersion": "2023-12-13",
  "EventTime": "2021-02-03T18:59:30.194Z",
  "Payload": {
    "SellerId": "XXXXXXXXXXXX",
    "MarketplaceId": "ATVPDKIKX0DER",
    "Asin": "TEST",
    "Sku": "TEST",
    "Severities": [
      "ERROR",
      "WARNING"
    ],
    "EnforcementActions": [
      "SEARCH_SUPPRESSED",
      "LISTING_SUPPRESSED",
      "ATTRIBUTE_SUPPRESSED",
      "CATALOG_ITEM_REMOVED"
    ]
  },
  "NotificationMetadata": {
    "ApplicationId": "amzn1.sellerapps.app.f1234566-aaec-55a6-b123-bcb752069ec5",
    "SubscriptionId": "93b098e1-c42-2f45-93a1-78910a6a8369",
    "PublishTime": "2021-02-03T18:59:30.194Z",
    "NotificationId": "0e999936-da2c-4f9c-9fc2-02b67bae5f49"
  }
}
```

Use enhanced JSON Processing Report feature for bulk monitoring

By default, the `JSON_LISTINGS_FEED` processing report only includes a list of synchronous issues that prevented acceptance of the submissions. To retrieve a complete list of both synchronous and asynchronous processing issues, specify the `issues` parameter in the `includedData` property in the feed header when constructing a JSON feed payload.

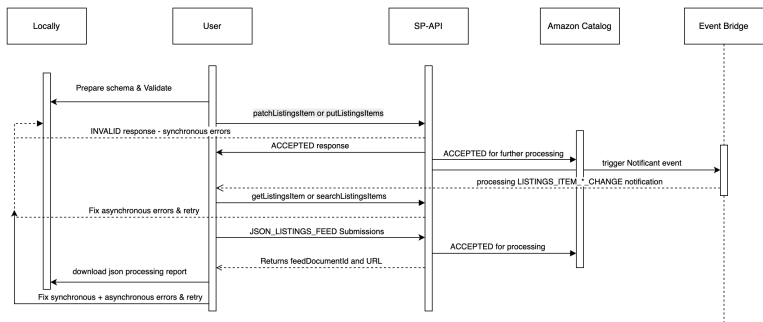

The following is an example of a JSON feed with requested `issues` property set:

```
JSON
{
  "header": {
    "sellerId": "{{sellerId}}",
    "version": "2.0",
    "issueLocale": "en_US",
    "report": {
      "includedData": [
        "issues"
      ],
      "apiVersion": "2021-08-01"
    }
  },
  "messages": [
    {}, {}
  ]
}
```

When you request `issues` in a `JSON_LISTINGS_FEED` submission, Amazon generates the processing report only after processing all feed items. You can use this feature to request other details (for example, summaries or attributes) about the listings item. Ensure that you pass only the information you need to optimize for the processing time. To request additional data in the enhanced processing reports, refer to the `JSON_LISTINGS_FEED` [Processing report schema](#) for the schema of the feed type and other available options.

Troubleshoot Listings Item Issues

The following diagram provides an overview of the workflow steps to handle listings item issues.

Note

Fulfillment Inbound API FAQ

Migrating Fulfillment Inbound workflows

Fulfillment Inbound API Rate Limits

FULFILLMENT OUTBOUND API

Fulfillment Outbound Dynamic Sandbox Guide

Fulfillment Outbound API

In most cases, implementing one best practice might not be enough. Combine multiple approaches (notifications, bulk operations, direct API calls) to effectively manage listings issues and reduce call volume.

Follow the steps to troubleshoot listings submission issues:

1. Identify the selling partner SKU with issues that need to be resolved.
2. If you need to inspect existing issues, call the `getListingsItem` operation with the identified SKU. Ensure that you include `issues` in the `includedData` parameter to retrieve a list of existing errors.
 1. You can also use the `searchListingsItems` to retrieve information about multiple listings based on SKU, ASIN, or supported identifier. Refer to [Search for listings items by product identifier or other listings parameters](#) tutorial to learn more.
3. Review the `issues` object to inspect the associated listings issue. Verify the `categories` to understand the types of issues category and review the `enforcements` actions. Prioritize fixing issues that could impact the status of the selling partner listings. Address the critical issues relevant to your use case, then resubmit the corrected listing data. Refer to the [Listings Items API reference](#) documentation to see applicable values for issues, categories, and enforcement actions.
4. For the `JSON_LISTINGS_FEED` , download and review the processing report after each upload. If you have requested an enhanced processing report in the feed submission, you will receive processing report only after Amazon validates and processes all the items present in the feed message.
5. For ongoing monitoring and automation, instead of repeatedly calling direct API operations, subscribe to asynchronous `LISTINGS_ITEM_ISSUES_CHANGE` and the `LISTINGS_ITEM_STATUS_CHANGE` notifications to receive listings issues reported after making the submission. Then inspect the information received in the notifications payload and call further APIs, if necessary.

For information on synchronous listings issues examples and preventative actions, refer to the [Listings Items API Issues troubleshooting](#) guide. To understand common asynchronous error messages, their definitions, and suggested solutions, refer to the [Error code explanations](#) in the Seller Central.

If you would like to share feedback on the error or report defects with errors, open a case with our [developer support team](#).
