Manage Product Listings with the Selling Partner API

Manage your product listing lifecycle using SP-API.

This guide describes the lifecycle of listings on Amazon and the Selling Partner APIs that can be used to manage it.

Product listings lifecycle

The lifecycle of creating and managing listings on Amazon typically involves the following:

1. **Discovery**
1. Does Amazon already have the item I want to sell in its catalog?
2. Where does my item fit within Amazon's catalog hierarchy?
3. What is required to create items in the Amazon catalog?
4. Am I eligible to list items in the Amazon catalog?
2. **Creation**
1. Have I met the data requirements to create a new item or list an existing item?
2. Was my submission accepted?
3. **Maintenance**
1. What is the state of my listing? Is it buyable? Is it discoverable?
2. Do I have any issues associated with my listing?
3. Does my listing continue to meet Amazon data requirements?

Selling Partner APIs for Product Listings

The following Selling Partner APIs can help you manage your product listings:

- [Product Type Definitions API](#): get the requirements for listing an item.
- [Listings API](#): create and maintain listings.
- [Catalog Items API](#): discover the contents of the catalog.
- [Notifications API](#): receive updates about listings.

These APIs provide the following core capabilities for listing creation and management:

- Querying data from the Amazon catalog (ASINs).
- Querying and traversing the Amazon catalog hierarchy (classifications, browse nodes).
- Retrieving schemas describing Amazon data requirements by product type.
- Retrieving listings eligibility details by ASIN or product type.
- Creating, querying, updating, and deleting listings (SKUs).

In addition, these APIs provide programmatic notifications that enable event-driven workflows for third-party developers and sellers.

Product Type Definitions API

The [Selling Partner API for Product Type Definitions](#) provides programmatic access to attribute and data requirements for product types in the Amazon catalog. With this API, you request requirements for a product type in a given marketplace and receive responses including a JSON schema that describes all requirements, attributes, and the conditionality of the requirements. You can use this JSON schema to either validate the payload you already have or map it to your ERPs (Enterprise Resource Planning).

The following example uses the `getDefinitionsProductType` operation to request the `LUGGAGE` product type in the NA marketplace in American English:

```
HTTP

GET https://sellingpartnerapi-na.amazon.com/definitions/2020-09-01/productTypes/LUGGAGE?marketplaceIds=ATVPDKIKX0DER&locale=en_US
```

The following example shows a response to the preceding request and provides the `ProductTypeDefinition` of the `LUGGAGE` listing:

```
JSON

{
  "metaSchema": {
    "link": {
      "resource": "https://...",
      "verb": "GET"
    },
    "checksum": "QFQDmPwMAR07vwMEyLh0tw=="
  },
  "schema": {
    "link": {
      "resource": "https://...",

        "other_offer_image_locator_4",
        "other_offer_image_locator_5"
      ]
    }
  },
  "images": {
    "title": "Images",
```

Feeds JSON Schemas

Listings Items API

The following example uses the `get listingsItem` operation to request an `Item` from a seller with a sellerId of "AXXXXXXXX" in the NA marketplace in American English. It requests summaries, attributes, issues, offers, and fulfillmentAvailability to be in the Item in the response.

The following example shows a response to this request is an `Item` with summaries, attributes, issues, offers, and fulfillmentAvailability:

```
JSON {
  "brand",
  "supplier_declared_has_product_identifier_exemption",
  "externally_assigned_product_identifier",
  "merchant_suggested_asin",
  "item_type_keyword",
  "item type name".
}
```

JSON	"merchant_suggested_asin", "item_type_keyword", "item type name",

Catalog Items API

The [Selling Partner API for Catalog Items](#) provides programmatic access to information about items in the Amazon catalog. In other words, you can search Amazon's catalog for products,

match your products to the existing product listings on Amazon, and then make sourcing and pricing decisions for listing those products.

The following example uses the `getCatalogItem` operation to request an item with ASIN XXXXXXXXXX in the NA marketplace. It requests a response with an `Item` that contains attributes, identifiers, images, product types, salesRanks, summaries, variations, and vendorDetails:

VAT Calculation Service

>

```
HTTP
{
  "main_product_image_locator": [
    {
      "media_location": "https://media-origin-na-ssl.integ.amazon.com/images/I/xxxxx1.jpg",
      "marketplace_id": "ATVPDKIKX0DER"
    }
  ],
  "other_product_image_locator_1": [
    {
      "media_location": "https://media-origin-na-ssl.integ.amazon.com/images/I/xxxxx3.jpg",
      "marketplace_id": "ATVPDKIKX0DER"
    }
  ],
  "other_product_image_locator_2": [
    {
      "media_location": "https://media-origin-na-ssl.integ.amazon.com/images/I/xxxxx3.jpg",
      "marketplace_id": "ATVPDKIKX0DER"
    }
  ]
}
```

The following example shows a response to this request that contains an `Item` with all the requested information:
