Manage resource capacity schedules and reservations

Learn how to manage service resource capacity schedules and support appointment availability and reservations that exclude scheduled capacity from appointment availability.

Learn how to manage service resource capacity schedules and support appointment availability and reservations that exclude scheduled capacity from appointment availability.

Capacity management operations eliminate manual integration and operation processes related to resource capacity. With these operations, you can provide the availability of a resource in real time. *Schedule* provides a resource's availability. *Reservation* provides a

resources's

unavailability.

- [updateSchedule](#) is used to create or update resource capacity schedules that make capacity available for service job appointments.
- [createReservation](#) is used to block out portions of scheduled resource capacity from being available for service job appointments.
- [updateReservation](#) is used to update reservations in order to account the need to shift existing block outs on resource capacity schedules.
- [cancelReservation](#) is used to remove reservations no longer needed to block portions of resource capacity schedules.

Prerequisites

To complete this tutorial, you need:

- Authorization from the seller for whom you are making calls. Refer to [Authorizing](#)

[Selling Partner Applications](#) for more information.

Update a resource schedule

> The `updateSchedule` operation creates or updates resource capacity schedules, which are the basis for capacity-driven appointment scheduling.

> `updateSchedule` overwrites the resource's existing schedule, so you can use it to provide a resource's schedule for the first time and for subsequent changes. The schedule continues to be valid until the `endTime`, or `recurrence`'s `endTime` if you provide `recurrence`. The minimum slot duration is five minutes for US marketplaces and 30 mins for UK and DE marketplaces. There is no way to clear the schedule of a resource; providing an empty schedule is considered an invalid request.

Create a reservation against a resource

The

`createReservation`

operation creates a reservation against a resource, which reduces available capacity for that time-frame.

For service reservations, the duration is standard and is Amazon-defined. Creating a reservation requires that the resource has the requested capacity available in that time frame. A walk-in appointment for a tire-change is an example of where

`createReservation`

can be used. If you want to assign resource `R1` to this job, call the API with `R1` as the `resourceId`, with start and end times of the job and `APPOINTMENT` as the type.

Update an existing resource reservation

The

`updateReservation`

operation updates a reservation against a resource, reducing available capacity for that time-frame.

This operation can reschedule a

reservation. No other fields can be changed except the start-times and end-times of the reservation. This operation succeeds only if there is sufficient capacity of the resource available at the new time frame. The response contains the `reservationId` of the reservation you update.

Note

A successful call returns a new `reservationId` that can be used to make further changes to this reservation. The previous `reservationId` can be discarded.

Cancel a reservation

The

`cancelReservation`

operation cancels a reservation. Cancelling a reservation creates capacity for available appointment opportunities.
