Messaging API

Learn how to use the Messaging API.

You use the [Messaging API](#) to send messages to buyers.

Current version	Legacy versions	Availability	Sandbox
v1 (Reference Model)	None	Sellers only	Static

► [Release notes](#)

To learn more about the terms that are used in this guide, refer to [Terminology](#).

Message availability

Not all message types are available in all circumstances. There are a number of factors that can affect message availability, including whether the order has been fulfilled, the type of seller, or the number of messages already sent for the order.

Workflow for sending a message

The following is for the user of the application. Sending a message is a multi-step process that includes calls to operations in both the Messaging API and the Uploads API. Here is the basic workflow for sending a message:

1. Your application displays the seller's recent orders, and the seller chooses an order for which they want to send a message to the buyer.
2. Your application displays the message types that are available for the order that the seller chooses. Get the available message types by calling the

Messaging API

`getMessagingActionsForOrder` operation of the Messaging API.

- The seller chooses a message type for the order.
- If custom messages are supported for the message type, the seller inputs a custom message.
- If attachments are supported for the message type, the seller uploads an attachment to your application. The seller also inputs a file name for the attachment.
- If the seller uploads an attachment to your application, your application uploads the attachment to an Amazon S3 bucket by doing the following:
 - Calculating a Content-MD5 hash for the attachment, which is needed for creating an upload destination.
 - Creating an upload destination by calling the `createUploadDestination` operation of the Uploads API.
 - Uploading the attachment to the destination.
- Your application requests that a message be sent from the seller to the buyer by calling the operation that corresponds to the message type that the seller chose in step #3. For example, your application calls the `createConfirmOrderDetails` operation if the seller chose the "Confirm order details" message type.
- Amazon emails a message from the seller to the buyer. Refer to [Tutorial: Send a message](#) for the detailed workflow.

Use cases

The following use case example is available for the Messaging API v1:

- [Send a message](#): Learn how to make an application that lets a seller send a message to a buyer.
