Price Adjustment Automation Workflows Guide

Integrate with the Product Pricing API to optimize your Amazon Listing prices.

This guide describes how to use the Product Pricing API and Pricing notifications to build best-in-class workflows that automate pricing management. Pricing automation helps selling partners compete more effectively by submitting price changes programmatically, and defining pricing rules.

🔗 API versions

This guide references operations in the following Selling Partner API sections. For more detailed information about the individual API operations listed, follow the referenced links.

API reference	API Version	Use Case Guide
Notifications API	v1	Notifications API Use Case Guide
Product Pricing API	2022-05-01	Product Pricing API Use Case Guide
Product Pricing API v0	v0	Product Pricing API v0 Use Case Guide
Listings Items API	2021-08-01	Listings Items API Use Case Guide

Subscribe to pricing notifications

The workflows in this guide describe actions against pricing changes from competitors or Featured Offer disqualification. By subscribing to and monitoring the [ANY OFFER CHANGED](#) and [PRICING_HEALTH](#) notifications, you can build event-driven workflows that respond in real-time to these changes. To learn how to set up and create a destination and creating subscriptions, refer to [Tutorial: Set up notifications \(Amazon Simple Queue Service workflow\)](#).

Use [PRICING_HEALTH](#) to update the price against a featured offer disqualification event

The following diagram provides an overview of the workflow steps to update the price against a featured offer disqualification event.

Follow these steps to respond to a featured offer disqualification and update price in near real-time.

1. Subscribe the selling partner to the [PRICING_HEALTH](#) notification. Refer to [Tutorial: Set up notifications \(Amazon Simple Queue Service workflow\)](#) for more information.
2. If an offer is disqualified to be the Featured Offer, a [PRICING_HEALTH](#) notification is sent and posted to your SQS queue.
3. Poll the SQS Queue to retrieve the message. Observe in the payload that the

Special Authorization Types

>

`issueType` is

`BuyBoxDisqualification` , which means the selling partner's offer is disqualified from being the Featured Offer.

INTEGRATION

Building Robust Amazon SP-API Applications

SP-API SDKs

>

4. Process the item affected by retrieving the ASIN information in the notification payload. The notification can provide different price points. You can create rules (which your sellers have the option to enroll in) to adjust the offer's `LandedPrice` (`ListingPrice` + `Shipping` - `Points`) so it matches or becomes lower than the competitive price, or is in line with the reference prices.

**Note: Reference prices**

The Pricing Health notification might include the Featured Offer price `buyBoxPrices` , `competitivePriceThreshold` from external competitors, 60-day `averageSellingPrice` , the highest 14-day (shipped and sold by Amazon) `retailOfferPrice` , and the `listingPrice` . For more information regarding reference prices, refer to `referencePrice` .

To be Featured Offer eligible, you must provide great prices, availability, and delivery speed. The Featured Offer is the offer selected when the customer chooses **Add to Cart** on the product detail page.

5. Set the price for the item and update it locally. Use the enrolled rules to confirm the price change with the seller (for example, use `competitivePriceThreshold` if available in the notification.)
6. (Optional) Before submitting the price change, call the `patchListingsItem` operation with `mode=VALIDATION_PREVIEW` to preview pricing issues such as Featured Offer disqualification or pricing policy violations. For more information, refer to

SELLING PARTNER APPSTORE

What is the Selling Partner Appstore?

List Your App on the Selling Partner Appstore

[Preview errors before creating or fully updating a listing](#) and [Pricing validation issues](#).

- Use JSON code to submit the offer with updated price attributes. Ensure that you adhere to the JSON Schema for the product type.

Note: Validate your JSON schema

Check that the listing data meets requirements prior to submission by using JSON Schema validation utilities. Refer to [Amazon Product Type Definition Meta-Schema \(v1\)](#) for details on validating data with the product type JSON Schemas. Ensure that the required attributes are provided, all values are valid, any conditional rules are accounted for, and all schema requirements are met.

- Call the `patchListingsItem` operation, to submit the price.

Request example

```
PATCH https://sellingpartnerapi-na.amazon.com/listings/2021-08-01/items/XXXXXXXXXXXX/ABC123?marketplaceIds=ATVPDKIKX0DER&issueLocale=en_US
```

JSON

```
{
  "productType": "PRODUCT",
  "patches": [
    {
      "op": "replace",
      "path":
"/attributes/purchasable_offer",
      "value": [
        {
          "marketplace_id":

```

9. Inspect the response to identify that the submission is `ACCEPTED` . If accepted, initial validations have passed and the price data is submitted for further processing with the Amazon catalog. If not accepted, one or more validation issues prevented acceptance; refer to [Handling listings item issues](#) for more information. Correct the validation issues and resubmit.

10. Check for new `PRICING_HEALTH` notifications in order to respond to any new item changes.

Use the `ANY_OFFER_CHANGED` notification to respond to price updates

The following diagram provides an overview of the workflow steps to update pricing against the top 20 competitors' offer changes.

1. Subscribe the selling partner to the `ANY_OFFER_CHANGED` notification. With this notification, you can use `eventFilters` to filter for an aggregate time of five or ten minutes, or a Marketplace Id.

2. The `ANY_OFFER_CHANGED` notification is sent and posted to your SQS queue when:

- 1. The seller's item receives a change to any of the top 20 offers, by condition

2. The external price (the price from other retailers) changes for an item
3. There's a change to which offer wins the Featured Offer
4. There's a change to the Featured Offer price
3. Poll the SQS Queue to retrieve the message to receive the `ANY_OFFER_CHANGED` notification. To detect which type of change occurred, you must interpret the `OfferChangeTrigger` value in the notification body.
4. Process the item affected and identify if a price update is needed. To do this, retrieve the ASIN, confirm the item condition, and confirm the Fulfillment Type in order to reprice the correct item for your seller. To update the price, confirm that the seller wants to update it using automatic pricing rules (for example, decrease the item price until a certain percentage or monetary value threshold occurs).
5. Set the appropriate price for the item and update it locally. You can use the enrolled rules to confirm the price change with the seller.
6. (Optional) Before submitting the price change, call the `patchListingsItem` operation with `mode=VALIDATION_PREVIEW` to preview pricing issues such as Featured Offer disqualification or pricing policy violations. For more information, refer to [Preview errors before creating or fully updating a listing](#) and [Pricing validation issues](#).
7. Use JSON code to submit the offer with updated price attributes. Ensure that you adhere to the JSON Schema for the product type.

Note: Validate your JSON schema

Check that the listing data meets requirements prior to submission by using JSON Schema validation utilities. For more information on how to
