# Retrieve a Product Type Definition

Learn how to return Amazon Product Type Definitions and related schemas from the Product Type Definitions API for a given selling partner, Amazon product type, and Amazon marketplace.

Learn how to return Amazon Product Type Definitions and related schemas from the Product Type Definitions API for a given selling partner, Amazon product type, and Amazon marketplace.

## Prerequisites

To complete this tutorial, you need:

- Authorization from the Selling Partner for whom you are making calls. Refer to [Authorizing Selling Partner API applications](#) for more information.
- Approval for the [Product Listing role](#) in your developer profile.
- The Product Listing role selected in the App registration page for your application.

## Step 1. Retrieve the Product Type Definition

Call the `getDefinitionsProductType` operation to retrieve an Amazon Product Type Definition from the [Product Type Definitions API](#).

## Step 2. Retrieve the schema documents

In the previous step, the retrieved Amazon Product Type Definition includes details about the Amazon

## Retrieve a Product Type Definition

product type and links to retrieve the meta schema and product type schema documents. The links provided are valid for seven days.

Schema documents can be retrieved programmatically with a standard HTTP client or manually with a web browser.

### Note

Include the optional `sellerId` parameter to retrieve the seller-specific attributes, including B2B audience values. The API returns B2B attributes only when the seller is enrolled in the Amazon Business program. If the `sellerId` is not provided, the API returns a generic schema without the seller-specific configurations.

### ! Meta schema names cannot be resolved using the web

The Amazon Product Type Definition JSON schema document references the meta schema by name. Some JSON schema libraries attempt to resolve meta schema names online via the web, which the [Amazon Product Type Definition Meta-Schema \(v1\)](#) does not support. These libraries should be configured to use a downloaded copy of the meta schema instead. Refer to the accompanying [Amazon Product Type Definition Meta-Schema \(v1\)](#) documentation for more details.

**parentageLevel  
parameter**

- Performance Management

You can use the optional `parentageLevel` query parameter to retrieve a JSON Schema applicable to a specific listing type. When you provide this parameter, the schema includes only the attributes and requirements relevant to the specified parentage level.

| Value      | Description                                                                                                                                                                            |
|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CHILD      | Schema for <b>variation child listings</b> . Includes attributes applicable to listings with a parent-child variation relationship. The <code>parent_sku</code> attribute is required. |
| PARENT     | Schema for <b>variation parent listings</b> . Includes attributes applicable to variation group containers.                                                                            |
| STANDALONE | Schema for <b>standalone listings</b> with no variation relationships. Variation-related attributes are excluded.                                                                      |

When `parentageLevel` is omitted, the full schema with all conditional logic is returned.

Retrieve a schema for a child listing example

```
GET /definitions/2020-09-01/productTypes/SHIRT ?
marketplaceIds=ATVPDKIKX0DER
&requirements=LISTING
&requirementsEnforced=ENFORCED
&locale=en_US
&parentageLevel=CHILD
```

Retrieve a schema for a parent listing example

```
GET /definitions/2020-09-01/productTypes/SHIRT ?
marketplaceIds=ATVPDKIKX0DER
&requirements=LISTING
&parentageLevel=PARENT
```

## Retrieve a schema for a standalone listing example

```
GET /definitions/2020-09-01/productTypes/LUGGAGE ?
marketplaceIds=ATVPDKIKX0DER
&requirements=LISTING
&parentageLevel=NONE
```

When you create listings that are not part of a variation family, include `parentageLevel=NONE` when calling `getDefinitionsProductType` to retrieve a schema applicable to standalone listings. Variation-related attributes are excluded from the returned schema.

For more information about configuring variation families, refer to [Configure related listings items](#).
