What is the Selling Partner API?

Selling Partner API Onboarding Overview

Special Authorization Types

Learn about SP-API scenarios that require special authorization approaches.

Although most Selling Partner API (SP-API) calls follow the standard authorization workflows, some scenarios require different approaches. This topic describes three special cases that have unique authorization requirements.

Grantless operations

Some SP-API operations don't require explicit selling partner authorization. These *grantless* operations typically access public data or perform functions that don't involve seller-specific information.

For details about which operations are grantless and how to

Terminology

Frequently Asked Questions

authorize these calls,
refer to [Grantless
Operations](#).

Selling Partner API Roles >

Vendor group authorization

Vendor applications have a unique authorization model based on vendor groups. When you authorize a vendor application, the authorization applies to all vendor codes associated with your Vendor Central sign-in credentials.

To learn how to handle vendor group authorization, refer to [Authorize your Application to Access Vendor Groups](#).

Restricted data access

Some SP-API operations access sensitive information, such as personally identifiable information (PII). These operations require an additional layer of security through a Restricted Data Token (RDT).

For information about identifying restricted operations and implementing RDT authorization, refer to [Authorization with the Restricted Data Token](#).
