Frequently Asked Questions >

Step 6: Set up the Authorization Workflow

Configure how sellers authorize your application to call the SP-API on their behalf.

While the sandbox environment lets you explore the Selling Partner API (SP-API) functionality with test credentials, production applications need a complete authorization system that lets selling partners safely grant access to their data.

Choose your authorization method based on your application type:

- **Public applications:** Must use [OAuth 2.0](#) through [Login with Amazon](#) (LWA). Selling partners can authorize your application [through the Selling Partner Appstore](#)

or [through your website](#).

- **Private applications:** You can [self-authorize](#) these applications directly from the [Solution Provider Portal](#).

This topic describes these authorization workflows and set-up steps.

Terminology

Although you can self-authorize *private* applications, sellers authorize *public* applications through an OAuth 2.0 workflow. When you set up authorization for public applications, you assemble URIs, get tokens from the LWA authorization server, and fetch your client credentials from the Solution Provider Portal. The following sections briefly define these terms in the context of the SP-API.

Login with Amazon (LWA)

Amazon's OAuth 2.0 service that handles authorization between your application, selling partners, and the SP-API. During runtime, both public and private applications call LWA to

exchange a refresh token for an access token to include in requests to the SP-API.

>

Log-in URI

A URI that lets selling partners *log in* to your website during the authorization flow, which enables you to associate the seller's Amazon authorization with their account in your system.

>

Authorization URI

A URI that lets selling partners *authorize* your application to access their data.

>

Redirect URI

A URI that *redirects* selling partners back to your website after authorization is complete.

Token

A secure digital key that represents authorization to access SP-API resources on behalf of a selling partner.

Access token

A short-lived credential that your application uses to make SP-API calls on behalf of a selling partner.

Refresh token

Steps to set up authorization

Learn how to set up different authorization workflows depending on whether your app is public or private.

Steps to set up the Selling Partner Appstore authorization workflow (public applications only)

The following steps explain how to set up authorization when sellers find and authorize your application through the Selling Partner Appstore. For more information, refer to [Selling Partner Appstore Authorization Workflow](#).

1. Configure your website as follows:

- 1. Set the `referrer-policy no-referrer` HTTP header to prevent cross-site request forgery.
- 2. Set up regional sign-in if you support multiple regions.

2. Create a log-in URI page on your website and configure it to:

the Selling Partner Appstore and have them choose **Authorize Now**.

5. Process the authorization response from Amazon, including:

1. Authorization code.

2. State verification.

3. Selling partner ID.

6. Exchange the authorization code for a refresh token.

7. Store the refresh token securely.

8. During runtime, before you call the SP-API, exchange the refresh token for an access token to include in the API call.

9. Test your authorization workflow to ensure that your application can exchange parameters with Amazon and receive authorization information. To test in beta:

1. Include the `version=beta` a parameter in your authorization URI.

responses
from Amazon.

2. Handle parameters securely.
3. Validate state parameters to prevent cross-site request forgery.

4. Build the Seller Central authorization URI for seller login as follows:

1. Start with the [Seller Central URI](#) for your target marketplace.

2. Add `/apps/authorize/consent`.

3. Add a placeholder for your application ID. (You get an application ID from the Solution Provider Portal after you register your application in [Step 7: Register Your Production Application](#).)

4. If you're testing, add `version=beta`.

information, refer to [Self Authorization](#).

- 1. Sign in to Solution Provider Portal.
- 2. Locate your application.
- 3. Next to **Edit App**, choose **Authorize**.
- 4. Select **Authorize app** for each selling partner account that you want to authorize.
- 5. Save the refresh token that appears for each authorization. This process generates an LWA refresh token with a maximum of 10 authorizations per application.
- 6. Store the refresh tokens securely.
- 7. During runtime, before you call the SP-API, exchange the refresh token for an access token to include in the API call.
