Vendor Analytics Dataset Use Case Guide

How to use the Vendor Analytics dataset with Data Kiosk.

This guide describes the specifics of the [Vendor Analytics dataset](#). For general information about the usage of Data Kiosk, refer to the [Data Kiosk API Use Case Guide](#).

The vendor analytics dataset in Data Kiosk has the following benefits:

- **Cross-domain analytics:** Structure custom queries to access metrics across multiple domains such as sales, traffic, and inventory. You can do this in a single query to explore Selling Partner use cases and address business priorities. Additionally, this dataset allows you to aggregate data at date, ASIN, brand manufacturing, and other granularities in the same query. For example, you view sales metrics per day, week, or month at ASIN granularity.
- **Comprehensive metrics:** More than 100 metrics across sales, traffic, inventory, and forecast domains.
- **Efficient API calls:** Retrieve only the data you need with minimal API calls. Additionally, you can fetch data from multiple marketplaces that you operate in with a single API call.
- **JSONL reports:** All reports are vended in a scalable [JSON Lines](#) format.
- **Secure data access:** Request visibility is limited to requests submitted by a given application, ensuring security of Selling Partner data.

To access the vendor analytics schema, download the schema: `analytics_vendorAnalytics_2024_09_30.graphql` . You can use any GraphQL tool to explore the schema and build queries. You cannot submit queries from these tools.

To submit the queries and retrieve your custom report, follow the steps in the [Data Kiosk Use Case Guide](#)

Metric access rights

The `analytics_vendorAnalytics_2024_09_30` dataset has a `sourcingView` and `manufacturingView` . You access the relevant view and its associated metrics based on the role assigned to the vendor (`SOURCING` or `MANUFACTURING`).

Manufacturing refers to any ASINs manufactured by the vendor, whereas **Sourcing** refers only to ASINs sourced directly from the vendor to Amazon (meaning the vendor is a distributor).

- `sourcingView` : Shows only data of ASINs sourced directly from the vendor. The metrics available in the sourcing view are listed in [Metrics in sourcing view](#). Certain metrics such as Glance Views are not available in `sourcingView` , and that `sourcingView` is the same as distributor view.
- `manufacturingView` : Shows data for all ASINs manufactured by the vendor (regardless of who sourced the products to Amazon). If a vendor (Vendor Group) does not manufacture any ASINs, then the query for accessing manufacturing view for the vendor returns `Error: VendorGroup does not have relevant rights to perform this operation` .

The vendor dataset allows for flexibility and cross-domain joins.

Metrics in sourcing view

The following set of metrics are available in the Sourcing View and vary depending on the category and domain. Refer to the [schema](#) for the definition of each metric.

Metric domains specific behavior

Some metric domains are not additive across time periods (for example, inventory metrics for a week cannot be added for each day). This section provides descriptions of behaviors of these metric groups.

Forecasting domain behavior

The forecasting domain contains forecasts that Amazon makes from Week zero to Week 47. Week zero is relative to the date on which the forecast was generated by Amazon.

This is a domain that is not additive across time periods, which means:

- Any date range provided in the query are not applicable for these metrics.
- The forecasts are refreshed on a weekly basis with new values refreshed for Week zero to Week 47 relative to forecast creation date.

Inventory domain behavior

Inventory metrics are a snapshot of the number of units available to be sold at the end of a period of time. These metrics are not additive and are only available for predefined time periods that are relevant to business decisions.

The currently supported time periods are:

- **Daily:** Only supported for the current common date. If you provide an invalid date, then the error message contains the correct date to use.

[Edit Your Appstore Listing](#)[Check Listing Status](#)[Appstore Ratings and Reviews](#)[Press Releases and Promotions](#)**SERVICE PROVIDER NETWORK**[List Your Service](#)**SECURITY AND COMPLIANCE**[SP-API Security and Compliance Overview](#)[Amazon Selling Partner API Guard Implementation Guide](#)

>

[VAT Calculation Service](#)

>

[Amazon Seller Data Access](#)[Best Practices](#)

>

- **Weekly:** Eight weeks. This time period includes the current week and the previous seven weeks.
- **Monthly:** 24 Months. This time period includes the current month and the previous 23 months.

Catalog attribute behavior

Catalog attributes (for example, ASINs and product titles) are always current and latest. There is no historical view of catalog data. Information about an ASIN is always based on the latest definition and there is no concept of “as of x date” for catalog reports.

Start- and end-dates provided in the query are not applicable to catalog attributes. When a query contains only catalog attributes and no metrics, the start- and end-data values provided are immaterial and the latest value for the catalog attribute is returned.

Geo Sales metric behavior

Geo Sales metrics (`shipToCountryCode` , `shipToCity` , `shipToStateOrProvince` , and `shipToZipCode`) provide geographic data for a shipment. Although these are considered `groupBy` metrics, they are not available in the Catalog report. Each request containing these Geo Sales metric must also contain at least one compatible non- `groupBy` metric.

The Geo Sales metrics may only be requested with the follow metrics and each Geo Sales request must contain at least one of these metrics:

- `netPPM`
- `salesDiscount`
- `shippedCogs`
- `contraCogs`
- `contraCogsPerUnit`
- `averageSalesDiscount`
- `shippedUnitsWithRevenue`
- `averageSellingPrice`

Customer Feedback metric behavior

Customer feedback metrics in the customer satisfaction domain consist of positive and negative customer review topic metrics, and return topic metrics. Each request that contains

A+ CONTENT API

Catalog Items API	>
Catalog Items API Rate Limits	
Catalog Items API v2022-04-01 Reference	
CUSTOMER FEEDBACK API	
Customer Feedback API	>
Customer Feedback API Rate Limits	

these customer feedback metrics must contain `asin` in the `groupByKey` .

Similar to the Forecasting and Catalog domains, customer feedback metrics are not additive across time periods. This means that any date range provided in the query does not apply to these metrics.

Date behavior

The query outputs are currently configured to automatically adjust the `startDate` and `endDate` based on the requested view and relevant date granularity selected. Certain checks are performed on every request to ensure that the requested date is valid. For example, `startDate` must be in the future and `endDate` must be before `startDate` .

Adjustments:

- The `startDate` for all reports weekly/monthly are adjusted to the beginning of a given time period. This means that weekly time periods always begin on Sunday, and monthly time periods always begin on the first day of the month.
- The `endDate` for all reports are adjusted to the end of a complete and valid time period. This means that the `endDate` cannot be in the future.
- **Partial data availability:** There are situations where data is available for parts of a time period, but not available for the entire time period. This scenario occurs when data is requested within one to two business days. In such cases, the response for days that are unavailable contains a null value.

Column Compatibilities

Some `groupBy` fields are not compatible with some metric fields. If you select these fields in the same request, you receive an error.

`vendorCode`

The `vendorCode` group-by field is not compatible with the following metrics:

- `orderedUnitsWithRevenue`
- `netOrderedGMS`
- `netShipmentGMS`
- `glanceViews`

FEEDS API

- forecasting
- lostFeaturedOffer

In the **manufacturing view**, the following metrics are disabled when you select the `vendorCode` group-by field:

- vendorConfirmationRate
- overallVendorLeadTime
- netReceived
- receivedFillRate
- procurableProduct00S
- openPurchaseOrderQuantity
- confirmedUnits
- mostRecentSubmitted
- netPPM
- salesDiscount
- shippedCogs
- contraCogs
- contraCogsPerUnit
- averageSalesDiscount
- unfilledOrderedUnits

Rules for query construction

- All queries should have at least one group-by field.
- When the data requested exceeds 1.5 GB, the response is truncated, and there might be missing rows or information.

Sample queries

Vendor sales report

SourcingView :

GraphQL

```
query MyQuery {
  analytics_vendorAnalytics_2024_09_30 {
    sourcingView(
      startDate: "2023-12-01"
      endDate: "2024-02-28"
      aggregateBy: WEEK
      currencyCode: "USD"
    ) {
      startDate
      endDate
      marketplaceId
    }
  }
}
```

Error messages

Error	Description
The requested columns are not compatible <requested columns> and no common date could be found.	Indicates that the columns provided in the request are not compatible and therefore cannot be queried together.
Start date should be before or equal to the end date.	The requested startDate cannot be after the requested endDate .
End date cannot be in the future	The requested endDate cannot be a future date.
Start date must be no more than two years ago.	The requested startDate is more than two years ago, which is not a valid input.
Need at least one groupable column in request.	At least one column must be added to the groupByKey in the request.

Error	Description
Selected Currency <currency> not supported.	The currency provided in the request is not supported.
Selected Granularity <granularity> not supported.	The aggregateBy field must be either DAY, WEEK, or MONTH.
VendorGroup does not have relevant rights to perform this operation.	The vendor requested manufacturingView without having any ASINs that they manufacture.
Weekly Inventory data is only available for 8 weeks, including the current week.	The request is for a weekly granularity, contains Inventory metrics, and the provided start date is more than eight weeks ago (including the current week).
Monthly Inventory metrics are only available for 24 months, including the current month.	The request is for a monthly granularity, contains Inventory metrics, and the provided start date is more than 24 months ago (including the current month).
Daily Inventory metrics are only supported for the current common date of <yyyy-mm-dd>	The request is for a daily granularity, contains Inventory metrics, and the provided start date and end date do not match or are not for the most current date. The most recent date is provided in the error message.
Requested marketplace is not supported.	The marketplaceId provided in the request is not supported.
getLeadingDate: Unrec	Unable to determine a date to serve the requested

Error	Description
overable error retrieving leading date for view	metrics for. This error can be the result of an availability issue.
Requests with shipTo* metrics may only contain the following non-GroupBy metrics: <metrics>	You can only request Geo Sales metrics with the metrics included in the error message.

FAQ

When is data ready?

All metrics in the vendor analytics dataset are ready after 34 hours. Data for a given day is available at 10 AM local time two days later. For example, data for January 1st is available at 10 AM local time on January 3rd. In the event that data is delayed and unavailable, the response is `null` for the specific date or dates for which data is unavailable.

Why is there a `0` for some dates?

When there are no sales on a given day, the response for that day contains `0` or similar placeholder data.
